MATH 136-03 Calculus 2, Spring 2019

Section 5.9: Compound Interest and Present Value SOLUTIONS

Exercise 1: Suppose that $P_0 = \$5,000$ is invested in an account paying at an annual rate of 7%. Find the amount in the account after 8 years if it is compounded (a) quarterly, (b) monthly, and (c) continuously.

Answer: (a) Use r = 0.07, M = 4, and t = 8 in the formula for compound interest:

 $P(8) = 5,000(1 + 0.07/4)^{4.8} = $8,711.07$ (rounding to the nearest cent).

(b) Use r = 0.07, M = 12, and t = 8 in the formula for compound interest:

 $P(8) = 5,000(1 + 0.07/12)^{12 \cdot 8} = \$8,739.13.$

(c) Use r = 0.07 and t = 8 in the formula for continuously compounded interest:

 $P(8) = 5,000e^{0.07 \cdot 8} = \$8,753.36.$

Exercise 2: A bank pays interest at an annual rate of 3.5%. What is the yearly multiplier (to 6 decimal places) if the interest is compounded (a) 5 times a year, (b) 30 times a year, or (c) continuously?

Answer: The yearly multiplier for compounding interest M times a year is $(1 + r/M)^M$. Thus we find (a) $(1 + 0.035/5)^5 \approx 1.035493$ and (b) $(1 + 0.035/30)^{30} \approx 1.035599$.

(c) When compounding continuously, the multiplier becomes e^r , so we obtain $e^{0.035} \approx 1.035620$.

Exercise 3: How much should you invest today in order to receive \$10,000 in 5 years if interest is compounded continuously at a rate of 2.5%?

Answer: Using the formula for present value (PV), we obtain $10,000e^{-0.025\cdot5} \approx \$8,824.97$

Exercise 4: Is it better to receive \$500 today or \$600 in 5 years if the interest rate is 3%? What if the rate increases to 4%? Assume that interest is compounded continuously.

Answer: (a) It is better to receive \$600 in 5 years if the rate is 3%. To see this, we calculate the present value of \$600 in 5 years, $600e^{-0.03*5} \approx 516.42 . Since this amount is *greater* than \$500, it is the better deal.

(b) Somewhat surprisingly, if the interest rate bumps up to 4%, then it is better to stick with the \$500 today. This follows because the present value of \$600 in 5 years with the new interest rate is $600e^{-0.04*5} \approx 491.24 . Since this value is *less* than \$500, it is not the better deal. Another way to see this is to compute the value of \$500 compounded continuously for 5 years at the new rate: $500e^{0.04*5} \approx 610.70 which is greater than \$600.

Exercise 5: Congratulations, you just won \$2 million dollars in the lottery! However, you do not get all of your money now; you will receive four yearly payments of \$500,000 beginning immediately. Assuming an interest rate of 5%, what is the present value of your prize? How much do you "lose" by not receiving the full prize today?

Answer: This is a tricky one. We need to compute the present value of each yearly payment and then add them together to see how they compare with \$2 million. The first payment starts the clock (time t = 0). We obtain

$$500,000 + 500,000e^{-0.05\cdot 1} + 500,000e^{-0.05\cdot 2} + 500,000e^{-0.05\cdot 3} = 500,000 \left(1 + e^{-0.05\cdot 1} + e^{-0.05\cdot 2} + e^{-0.05\cdot 3}\right) \approx \$1,858,387.41$$

The "loss" on our winnings is 2 million minus the present value or a whopping \$141,612.59.

Exercise 6: Find the PV of an income stream paying out continuously at a rate of \$750 per year for 10 years, assuming an interest rate of 5%.

Answer: We have

$$PV = \int_0^{10} 750e^{-0.05t} dt$$

$$= 750 \cdot \frac{1}{-0.05} e^{-0.05t} \Big|_0^{10}$$

$$= -\frac{750}{0.05} \left(e^{-0.5} - 1 \right)$$

$$\approx \$5,902.04.$$

Notice that this is substantially less than \$7,500.00, reflecting the loss of money caused by receiving payments over time rather than immediately.

Exercise 7: Find the PV of an investment that pays out continuously at a rate of $R(t) = \$1,000e^{0.03t}$ per year for 8 years, assuming an interest rate of 6%.

Answer: We have

$$PV = \int_0^8 1000e^{0.03t} \cdot e^{-0.06t} dt$$

$$= \int_0^8 1000e^{-0.03t} dt$$

$$= 1000 \cdot \frac{1}{-0.03} e^{-0.03t} \Big|_0^8$$

$$= -\frac{1000}{0.03} \left(e^{-0.24} - 1 \right)$$

$$\approx \$7,112.40.$$
